

# **Fundamentals of Computer Graphics and Image Processing Shadows (07)**

doc. RNDr. Martin Madaras, PhD.  
[martin.madaras@fmph.uniba.sk](mailto:martin.madaras@fmph.uniba.sk)

# Why shadows?

---

# Shadows in global methods

ray-tracing

radiosity

# Lights and shadows

- ▶ Two basic approaches
  - ▶ Hard shadows – only point light sources
  - ▶ Soft shadows – area light sources

# How the lectures should look like #1

---

- Ask questions, please!!!
- Be communicative
- More active you are, the better for you!

# Hard shadow

- Point light source

- A point is in a shadow if it is not visible from the light source

# Soft shadow

- ▶ Three types of surface:
  - ▶ **Shadow:** light source completely hidden
  - ▶ **Penumbra:** light source partially hidden
  - ▶ **Lit:** light source completely visible

# Shadows / visibility

A point is lit if it is visible from the light source

Computing shadows = visible surface determination

MIT EECS 6.837, Durand and Cutler

# Flat shadows

- ▶ Draw the graphics primitives again, projected on the ground
  - ▶ Fast, easy to code
  - ▶ No self shadows, no shadows on curved surfaces and no shadows on other objects

# Shadows in rasterization

Shadow volumes  
geometry space

Shadow maps  
screen space

---

# Shadow mapping

# Shadow maps

- ▶ z-buffer analogy
- ▶ look from the light
- ▶ “render” the scene and store depth information in a shadow map
  - ▶ 2D raster data
  - ▶ smallest distance between light and objects

# Shadow maps

- ▶ For a polygon pixel to be rendered
- ▶ Find its position in the light's projection plane  
→ transform camera-space position  $(x,y,z)$
- ▶ If  $z > \text{shadow map } [x,y]$   
then in shadow

# Shadow maps pros & cons

- ▶ memory consumption
  - ▶ 1 light = 1 shadow map
  - ▶ high resolution necessary
- ▶ aliasing
  - ▶ use high resolution
  - ▶ filtering necessary
- ▶ smooth (soft) shadows
  - ▶ when filtered
- ▶ imprecise due to z-buffer quantization (non-linear)
- ▶ light-specific transformation

# Shadow mapping example

depth buffer from  
light's point of view

final image

<http://www.nealen.net/projects/ibr/shadows.pdf>

# Shadow map resolution

- ▶ How many points are stored in the 2D shadow map
- ▶ Low counts = shadow artifacts

Stamminger, Drettakis: Perspective Shadow Maps

# Filtering and soft shadows

- ▶ Removes artifacts (jagged edges)
- ▶ Simulates soft shadows

Soft-Edged Shadows, <http://www.gamedev.net>

# Shadow volumes

# Shadow volumes

---

- ▶ create dummy geometry object extending each object in the direction of the light
  - ▶ shadow volume
- ▶ when displaying an object to a pixel  $(x,y,z)$ , test if  $(x,y,z)$  is inside/outside the shadow volume

# Shadow volumes

---

# Pseudo-code

---

1. Compute ambient light for whole scene and update z-buffer along with that
2. **Which screen areas are in shadow?**
3. For all areas outside the shadow:
  4. Compute diffuse and specular light components
5. Iterate for all lights

# Shadow volumes implementation

1. For each *shadow casters*, build a **shadow volume**
2. For each fragment, **count** how many times we enter (+1) and leave (-1) a shadow volume  
     $> 0$  : in shadow  
     $= 0$  : lit

J.Sochor, FI MU Brno

# Shadow volumes implementation

## Shadow Volumes algorithm

### Building a shadow volume

- Silhouette of each object from the light source
- Infinite quads touching
  - the light source
  - Each silhouette edge

### Counting entering/leaving

- Use the *stencil buffer*
- Use the orientation of each shadow quad for the sign

J. Sochor, FI MU Brno

# Shadow volumes implementation

## Stencil Buffer Algorithm

1. Initialize stencil buffer to 0
2. Draw scene with ambient light only
3. Turn off frame buffer & z-buffer updates
4. First pass: draw FRONT-facing shadow volume polygons,  
+ 1 to stencil buffer if z-pass
5. Second pass: draw BACK facing shadow volume polygons, - 1 to stencil buffer if z-pass
6. Turn on frame buffer updates
7. Turn on lighting and redraw pixels with counter = 0

J. Sochor, FI MU Brno

# Shadow volumes implementation

## Z-pass by example: how the stencil buffer is used

© 2006 Tomas Akenine-Möller

# Shadow volume pros & cons

---

- ▶ hard shadows
  - ▶ modifications for soft shadows necessary
- ▶ GPU implementation using stencil buffer
- ▶ high complexity for high-polygon models
- ▶ what if camera is inside the shadow volume?
- ▶ shadow volumes expensive on CPU
  - ▶ now vertex shaders

# Shadows vs. light types

---

- ▶ **Directional (parallel) light**
  - ▶ easy shadow maps and shadow volumes
- ▶ **Spot light**
  - ▶ shadow map by perspective transformation
  - ▶ easy shadow volume
- ▶ **Omni-directional light**
  - ▶ shadow map hard
  - ▶ easy shadow volume (same as spotlight)
- ▶ **Area light**
  - ▶ approximate by multiple lights

# How the lectures should look like #2

---

- Ask questions, please!!!
- Be communicative
- More active you are, the better for you!

# Rendering pipeline summary

---

## Summary

# Rendering pipeline summary

- ▶ Local, world (global), camera coordinates
- ▶ Transformations (in 2D & 3D)
- ▶ Matrix operations
  - ▶ translate, rotate, scale
  - ▶ projections (orthogonal, perspective)
- ▶ Object representation
  - ▶ boundary, volume, polygonal parametric, implicit, F-rep

# Rendering pipeline summary

---

- ▶ Line and polygon rasterization
- ▶ Linear interpolation
- ▶ Antialiasing
- ▶ Frustum - visible volume
- ▶ Back-face culling
- ▶ Painter's algorithm
- ▶ Z-Buffer

# Rendering pipeline summary

---

- ▶ Texture coordinates, texture mapping
- ▶ Texture filtering
  - ▶ Bilinear interpolation
  - ▶ Nearest neighbor

# Rendering pipeline summary

---

- ▶ Light types
- ▶ Lighting models and illumination techniques
  - ▶ local, global
  - ▶ empiric, physical
- ▶ Shading models
  - ▶ flat, Gouraud, Phong
- ▶ Raytracing, radiosity

# Rendering pipeline summary

---

- ▶ Shadow generation in global illumination
- ▶ Shadow generation in local models
- ▶ Stencil shadows (shadow volume)
- ▶ Shadow maps
- ▶ Soft shadows

# Next Lecture

---

## **Animations**

# Acknowledgements

---

- ▶ Thanks to all the people, whose work is shown here and whose slides were used as a material for creation of these slides:

Matej Novotný, GSVM lectures at FMFI UK

Peter Drahoš, PPGSO lectures at FIIT STU

Output of all the publications and great team work

Very best data from 3D cameras

# Questions ?!
